NMVS RELEASE - CORE 6.0 & REPORTING TOOL 6.0

As part of the continuous improvement approach towards the National Medicines Verification System (NMVS), *a new version of the system will be installed in the PROD environment and validated starting with 07.04.2025.*

Prior to PRODUCTION implementation, the system's new version will be installed in the IQE (test) environment and tested locally between 6th of March and 7th of April 2025, as Romania is once again Pilot country for this release.

The new features and modifications include:

❖ *Redesign of the NMVS Core interface – Final phase – Closure of the old interface*

In this final stage of the redesign, the latest visual and functional improvements are implemented to enhance the user experience on the NMVS Core platform. Similar to Core version 5.0, the key difference in this version is that the old interface will no longer be available, with all functionalities now accessible in the new graphical interface.

❖ *Deletion of the "News" and "System User" functionalities*

This step involves removing the "News" and "System User" modules to reduce complexity and improve the overall performance of the application.

❖ *Bug fixes from previous versions (prior to Core 6.00)*

Various errors identified in previous versions have been corrected, ensuring more stable operation before the release of the new Core 6.00 version.

❖ *System maintenance through technical improvements in Core 6.00*

This point covers maintenance activities, technical modernization, and adjustments to security criteria for newly discovered vulnerabilities in different technologies, aimed at enhancing the performance and security of the Core 6.00 version.

❖ *Update of the PKI portal's graphical interface*

By updating the PKI portal's graphical interface, the certificate download functionality becomes more intuitive and easier to use, thereby improving the efficiency of digital certificate management.

NATIONAL STUDY

The national study conducted by OSMR and ANMDMR (the National Agency for Medicines and Medical Devices), entitled: *”Attitudes of the Romanian Population towards Falsified Medicines”* is available on the OSMR website. It can be downloaded by clicking here: [NATIONAL STUDY](#).

THE DESTRUCTION TRANSACTION IS IRREVERSIBLE

OSMR's Operational Department emphasizes that the destruction transaction (G130) in the National Medicines Verification System (NMVS) *is final and cannot be undone. Once completed, it inactivates the medicine pack, and the “inactive status” assigned cannot be reversed.*

OSMR recommends that all End-Users confirm this transaction only after careful analysis, considering that it is irreversible and can generate errors in the system.
